### Theoretical Probability Versus Experimental Probability

Theoretical and Experimental Probability Equally likely outcomes have the same chance of occurring. When you toss a fair coin, heads and tails are equally likely outcomes. Favorable outcomes are outcomes in a specified event. For equally likely outcomes, the theoretical probability of an event is the ratio of the number of favorable outcomes to the

Theoretical probability is what we expect to happen, where experimental probability is what actually happens when we try it out. The probability is still calculated the same way, using the number of possible ways an outcome can occur divided by the total number of outcomes. As more trials are conducted, the experimental probability generally gets closer to the theoretical probability.

This is theoretical probability or guessing probability or probability based on assumption. In experimental probability, we want to take the guess work out of the picture, by doing the experiment to see how many times heads or tails will come up. If you flip a coin 1000 times, you might realize that it landed on heads only 400 times.
